

# Public Sector Consulting

Information Security consultancy designed to specifically address the governance and regulatory needs of the public sector

Cloud computing, online platforms and mobility solutions are shaping the way that the public interacts with government services and indeed the manner in which governments, at all levels, collaborate with each other.

The adoption of these new technology paradigms comes at a time Governments worldwide have had to respond to the increasingly difficult task of defending their sensitive information, critical infrastructure and reputations from the likelihood of a sustained and malicious security incident. Remaining vigilant of potential cyber-attack (including nation-state attacks), insider threat and Hacktivism is the reality for our Governments.

Accordingly, a greater emphasis is required on effective security policy, threat and risk assessment, control selection, management practices, and reporting.

In Australia, we have recognised the need to place additional responsibility on the custodians of our Personally Identifiable Information (PII) through the Privacy Amendment Act. This Act includes a set of new, harmonised privacy principles that will regulate the handling of personal information by both Australian government agencies and businesses.

In addition, various information security standards and guides have been developed for our governments. These include:

- Australian Government Information Security Manual (ISM)
- Australian Government Protective Security Policy Framework (PSPF)
- Australian Government Cyber Security Policy
- State Government Information Security Standards
- SCADA Security Good Practice Guides
- National E-health Security and Access Framework

Sense of Security has been selected as an endorsed supplier of information security and risk management services on numerous “Whole of Government” supply contracts. Our inclusion on these contracts reflects our commitment to government and professionalism, and our experience in providing specialist services to the public sector at a local, state and federal level.

## GOVERNANCE, RISK & COMPLIANCE

Information Security Management System – ISO 27001/2 Development

Risk Management – ISO 31000 & 27005

Payment Card Industry Data Security Standard

Australian Government Security Standards (ISM, PSPF & NESAF)

Cloud Computing Security Governance

Mobility Security Governance

Secure Development Lifecycle

## SECURITY STRATEGY & ARCHITECTURE

Information Security Architecture

Information Security Strategy & Roadmap

Information Security Policy & Procedure Development
